The present sequence is that of novel human low density lipoprote binding protein 2 (LBP-2). The amino acid sequence was deduced from coding region of isolated genomic DNA (see AAP26499). It differs sequence predicted from an LBP-2 cDNA clone (see AAB82803) by the presence of an additional 321 amino acids at the N-terminus (the clone is 5' truncated Human LBP-2 cDNA clone (see AAB82803) by the presence of an additional 321 amino acids at the N-terminus (the clone is 5' truncated). Human LBP-2 cDNA clone (see AAB82803) by the polypeptides of the invention that are capable of binding to nation methylated low density lipoproteins. Also claimed are biologicall fragments and analogues of LBPS, polymuclectides encoding LBPS, as expression vectors, cells and methods of producing the LBPS. Polypeptides having amino acid residues 329-343, 329-354, 344-354. 538 (see AAB82809-12) of the present sequence are claimed. Method determining an agent for use in treating atherosclerosis, methods: creating a cell having an abnormality in structure or metabolism are claimed. Pharmaceutical compositions computation an LBP polypel. New isolated low density lipoprotein binding polypeptide for trea diagnosing and/or identifying therapeutic agents for atherosclero Law SW, Arjona AA; Claim 13(j); Fig 7A; 143pp; English. Lees AM, Lees RS, Law SW, Arjona AA;

WPI; 2001-565505/63. N-PSDB; AAH26494. New isolated low density lipoprotein binding polypeptide for treat: diagnosing and/or identifying therapeutic agents for atheroscleros:

Claim 13(g); Fig 7B; 143pp; English.

The present sequence is that of the N-terminal portion of novel hun density lipoprotein binding protein 2 (LBP-2). The amino acid seque deduced from an isolated partial cDNA clone (see AAH26494). A full-sequence is given in AAB42666. Human LBP-2 is an example of claimed polypeptides of the invention that are capable of binding to native methylated low density lipoproteins. Also claimed are biologically fragments and analogues of LBPs, polynucleotides encoding LBPs, as as expression vectors, cells and methods of producing the LBPs method of determining if an animal is at risk for atherosclerosis, methods of determining an agent for use in treating atherosclerosis, and method treating a cell having an abnormality in structure or metabolism of are claimed. Pharmaceutical compositions comprising an LBP polypept uncleic acid, and vaccine compositions, are also claimed

polynucleotides, a method for producing a pharmaceutical composit method for identifying a compound or small molecule that regulates activity in an animal of one or more of the polypeptides given in specification, a method for identifying a compound useful in trea pain and a pharmaceutical composition composition comprising the one or more polypeptides or their antibodies. The polynucleotide or the compon modulates its activity is useful for preparing a medicament for ti
                                                                                                                                                                    pain (e.g. spinal segmental nerve injury (Chung), chronic construitioury (CCI) and spared nerve injury (SNI) in an animal (e.g. gei therapy). The sequence presented is a human protein (shown in Tab the specification) which is differentially expressed during pain. The sequence date for this patent did not form part of the printer specification, but was obtained in electronic form directly from itp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               407 MAAMNKEGGTASVATGPDSPSPVPLPPGKPALPGADGTPFGCPPGRKEKPSDPVEW

» density lipoprotein binding polypeptide for treating, or identifying therapeutic agents for atherosclerosis.

The present sequence is that of a full-length sequence of novel rated when the present sequence is that of a full-length sequence of novel rated low density lipoprotein binding protein 2 (LBP-2). The amino acid sequence is deduced from an incolated cDNA clone (see AAH26500). Rate LBP-2 is an example of claimed polypeptides of the invention, term LBPs, that are capable of binding to native and methylated low den lipoproteins. Also claimed are biologically active fragments and analogues of LBPs, polyunclectides encoding LBPs, as well as exprevences, cells and methods of producing the LBPs. Polypeptides have mino acid residues 318-35, 318-355, 314-356 or 444-453 (see AAB8 18) of the present sequence are claimed. Methods of determining if animal is at risk for atherosclerosis, methods for evaluating an a nimal is at risk for atherosclerosis, methods for treating an acharonality in structure or metabolism of LBP are also contained the paramaceutical compositions comprising an LBP polypeptide of the paramaceutical compositions comprising an LBP polypeptide or metabolism of LBP polypeptide or metabolism of LBP polypeptide or metabolism of LBP are also contained the paramaceutical compositions comprising an LBP polypeptide or metabolism of LBP are also contained to the paramaceutical compositions comprising an LBP polypeptide or paramaceutical compositions comprising an LBP polypeptide or metabolism of LBP are also contained and the paramaceutical compositions comprising an LBP polypeptide or metabolism of LBP are also contained and the paramaceutical compositions comprised to the paramaceutical compositions comprised to the paramaceutical composition of LBP are also contained to the paramaceutical composition of the paramaceutical compositions compressed the paramaceutical composition of the paramaceutical composition nucleic acid, and vaccine compositions Claim 13(k); Fig 2a; 143pp; English.

New isolated low density lipoprotein binding polypeptide for treat: diagnosing and/or identifying therapeutic agents for atheroscleros:

Claim 13(c); Fig 3; 143pp; English.

The present sequence is that of a partial sequence of novel rabbit density lipoprotein binding protein 2 (LBP-2). The amino acid sequideduced from an isolated cDNA clone (see AAH36489). Full-length ral LBP-2 is given in AAB82807. Rabbit LBP-2 is an example of claimed

```
of the invention, termed LBPs, that are capable of binding methylated low density lipoproteins. Also claimed are active fragments and analoques of LBPs, polynuclectides , as well as expression vectors, cells and methods of LBPs. Methods of determining if an animal is at risk for is, methods for evaluating an agent for use in treating is, and methods for treating a cell having an abnormality in metabolism of LBP are also claimed, as are pharmaceutical comprising an LBP polypeptide or nucleic acid, and vaccine

low density lipoprotein binding polypeptide for treating, I/or identifying therapeutic agents for atherosclerosis.

ig 4; 143pp; English.

equence is that of a partial sequence of novel rabbit low cotein binding protein 3 (LBP-3). The amino acid sequence is an isolated cDNA clone (see AAR56490). A full-length rabbit LBP-3 is given in AAB52801. Rabbit LBP-3 is an alimed polypeptides of the invention, termed LBBs, that are iding to native and methylated low density lipoproteins. It is biologically active fragments and analogues of LBPs, as encoding LBPs, as encoding LBPs, wethods of determining if an animal is at cosclerosis, methods for evaluating an agent for use in cosclerosis, and methods for treating a cell having an

The present sequence is that of a partial sequence of novel rabbit density lipoprotein binding protein 2 (LBP-2). The amino acid sequeduced from an isolated cDNA clone (See AAH26488). Full-length rice deduced from an isolated cDNA clone (See AAH26488). Full-length rice LBP-2 is given in AAB82807. Rabbit LBP-2 is an example of claimed to polypeptides of the invention, termed LBPs, that are capable of bit of native and methylated low density lipoproteins. Also claimed an biologically active fragments and analogues of LBPs, polymucleotic concoding LBPs, as well as expression vectors, cells and methods of producing the LBPs. Methods of determining if an animal is at rish atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnormatic compositions compositions unibs polypeptide or nucleic acid, and vectors compositions

```
abnormality in structure or metabolism of LBP are also claimed, a pharmaceutical compositions comprising an LBP polypeptide or nucl acid, and vaccine compositions
                                                                                               O

AAB34348 to sent human secreted polypeptide sequences and proteins hem, which are given in the exemplification of the present in secreted proteins have activities based on the tissues genes are expressed in. Example of activities include:

2; cytostatic; cardioactive; immunomodulatory; muscular; vulnerary; gastrointestinal; nephrotropic; antiinfective; and antibacterial. The polymucleotides can be used for 3f various disorders such as cancer, chromosome as chromosome markers, and for numerous other diagnostic poses. The secreted proteins can be used to treat as neural, immune, muscular, reproductive,

New isolated low density lipoprotein binding polypeptide for treas diagnosing and/or identifying therapeutic agents for atheroscleros

Claim 14(a); Page; 143pp; English.

The present sequence is that of a peptide comprising amino acid re 329-354 of movel human low density lipoprotein binding protein 2 see AABS206). Human LBP-2 is an example of claimed LBP polypeptic the invention that are capable of binding to native and methylated density lipoproteins (LDLB). Also claimed are biologically active fragments and analogues of LBPB, polymucleotides encoding LBPB, as expression vectors, cells and methods of producing the LBPB. Polypeptides having the present amino acid sequence are among thos claimed. Methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treating atherosclerosis, and methods for treating a cell having an abnorm structure or metabolism of LBP are also claimed, as are pharmaceut compositions comprising an LBP polypeptide or nucleic acid, and ve compositions. Note: the present sequence is not shown in the specification but is derived from the human LBP-2 sequence given i figure 7A (see AABB2206).

The invention relates to human nucleic acids (AAI57798-AAI61369) a encoded polypeptides (AAM3642-AAM42213) with nootropic, encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are in gene therapy. A composition containing a polypeptide or polyunc of the invention may be used to treat diseases of the peripheral nosystem, such as peripheral nervous injuries, peripheral neuropathy localised neuropathies and central nervous system disease, such a Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic alteral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activiti'nhibin activity, cancer diagnosis and therapy, drug screasing the receptor activity, anchor diagnosis and therapy, drug screasing for receptor activity, arthritis and inflammation, leukaemi. C.N.S disorders. Note: The sequence data for this patent did not fine part of the printed specification Example 4; SEQ ID NO 2737; 10078pp; English.

The invention relates to human cell factor signal inhibitor 11.88 (ABPS8930) and nucleic acids encoding it (ABZ57768). The protein landscular weight of 11.88 KD. The invention also relates to a mether recombinant production of the protein, an antagonist of the prand the use of the protein, gene and antagonist in therapeutic applications. Cell factor signal inhibitor 11.88 can be used in threatment of a variety of diseases such as malignant tumours, bloc diseases, HIV (human immunodeficiency virus) infection, immune diseasors signal inhibitor 11.88
                                                                                                                                                                         Human; cell factor signal inhibitor 11.88; recombinant production gene therapy; malignant tumour; cancer; blood disease; HIV infect human immunodeficiency virus; immune disorder; inflammatory condicytostatic; antiinflammatory; immunomodulator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polypeptide human cell factor signal inhibitor 11.88 and polynucleotides encoding this polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; Page 28 (Disclosure); 34pp; Chinese.

                                                                                                                                                                                                                                                                                                          New polynucleotides encoding full-length polypeptides, e.g. secret and/or membrane proteins, useful for developing medicines for dise which the gene is involved, or as target molecules for gene therap
                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel human secretory or membrane proteins (ADA54072-ADA55710) and their coding sequences (ADA52433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.

New isolated low density lipoprotein binding polypeptide for treat diagnosing and/or identifying therapeutic agents for atheroscleros

Claim 14(a); Page; 143pp; English.

The present sequence is that of a peptide comprising amino acid re 344.354 of novel human low density lipoprotein binding protein 2 (see AAB82806). Human LBP-2 is an example of claimed LBP polypeptid the invention that are capable of binding to native and methylated density lipoproteins (LDIS). Also claimed are biologically active fragments and analogues of LBPS, polymucleotides encoding LBPS, as a expression vectors, cells and methods of producing the LBPS. Polypeptides having the present amino acid sequence are among thos claimed. Methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treatic atherosclerosis, and methods for treating a cell having an abnorma structure or metabolism of LBP are also claimed, as are pharmaceut compositions comprising an LBP polypeptide or nucleic acid, and value of compositions. Note: the present sequence is not shown in the specification but is derived from the human LBP-2 sequence given in figure 7A (see AAB82806)

To identify antigens of E. tenella that elicit a mucosal immune reduring parasitic infection of chickens, E. tenella cDNA and genom: expression libraries in lambda phage were screened with chicken in lie. Phage that produce antigens cross-reactive with the immune ) were identified. The DNA inserts from the positive phage were clon bacteriophage M13 and subjected to sequence analysis. E. tenella it. 11. (13.9 kD) was identified. (Updated on 25-MAR-2003 to correst
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WRKY; plant; zinc-finger-type factor; WRKY; SAR; sunflower;

                                                                                                                                                                                                                                                                                                                                l describes a novel method for identifying individuals at oping spinocerebellar ataxia type 7 (SCA7). The method yzing the CAG repeat region of a SCA7 gene to detect CAG; individuals at risk have at least 30 CAG repeats and those ive less than 19 CAG repeats. The method is useful for dividuals at risk of developing SCA7 and also those at risk SCA1, 2, 3 or 6. The use of genomic DNA in the repeat ction (RED) analysis allows isolation of any potential repeat expansion regardless of the expression pattern. Idifferent oligonucleotides in the RED assay allows any of rinucleotide repeats to be detected, and the cycled nature in makes it extremely sensitive. This sequence represents a le human SCA7 protein which is described in the method of

Claim 25; SEQ ID NO 399; 424pp; English.

implicated in certain disease states. Compounds which modulate the proteins of the invention may have cytostatic, antiinflammatory, ophthalmological, antiarteriosclerotic or vulnerary activities. The sequences of the invention may be useful for gene therapy. The invent of the invention may be useful for gene therapy. The invent as the fording or treating a hypoxia-regulated conditioned as tumourigenesis, anglogenesis, apoptosis, inflammation, erythropoiesis, or the biological response to hypoxia conditions including processes such as glycolysis, gluconeogenesis, glucose transportation, catecholamine synthesis, iron transport or nitric of the processes are also as a such as such This invention relates to novel human genes and gene product which

New human nucleic acid associated proteins (NAAP), useful for diactreating and preventing diseases or conditions associated with the aberrant NAAP expression e.g. cancer, AIDS, atherosclerosis, epilo infections.

Claim 1; Page 187; 260pp; English.

and their corresponding nucleic acid sequences. The invention is in diagnosing, treating and preventing diseases or conditions assumit diagnosing, treating and preventing diseases or conditions assumit the decreased expression or Nath, such as continuous proliferative (e.g. cancer, atherosclerosis), neurological (e.g. cancer, atherosclerosis), neurological (e.g. allergies) and developmental (e.g. Hypothyroidism, Cushing's syndictions, or infections. It is also useful in assessing the effect exogenous compounds on the expression of nucleic acid and amino a sequences of NAAP. The NAAP or its fragments are useful in screen; compounds for which acts as their agonist or antagonist. The microis useful in monitoring or measuring protein-protein interactions, and gene expression profiles. NAAP DNA is use therapy. The present sequence is human NAAP protein The invention relates to human nucleic acid associated proteins ()

ow density lipoprotein binding polypeptide for treating, /or identifying therapeutic agents for atherosclerosis.

age; 143pp; English.

quence is that of a peptide comprising amino acid residues al human low density lipoprotein binding protein 2 (LBP-2, Human LBP-2 is an example of claimed LBP polypeptides of that are capable of binding to native and methylated low oteins (LDLs). Also claimed are biologically active analogues of LBPs, polynucleotides encoding LBPs, as well vectors, cells and methods of producing the LBPs.

vectors, cells and methods of producing the LBPs.

aving the present amino acid sequence are among those is methods for evaluating an agent for use in treating s, methods for treating an agent for use in treating s, and methods for treating an ell having an abnormality in stabolism of LBP polypeptide or nucleic acid, and vaccine Note: the present sequence is not shown in the out is derived from the human LBP-2 sequence given in AABB2806)

```
The present sequence is that of a peptide comprising amino acid re 44.453 of novel rabbit low density lipoprotein binding protein 2 see AAB82807). Rabbit LBP-2 is an example of claimed LBP polypeptic the invention that are capale of binding to native and methylated density lipoproteins (LDLs). Also claimed are biologically active fragments and analogues of LBPs, polymucleotides encoding LBPs, as expression vectors, cells and methods of producing the LBPs.

Polypeptides having the present amino acid sequence are among those claimed. Methods of determining if an animal is at risk for atherosclerosis, methods for evaluating an agent for use in treating at the construction of the construction of LBP are also claimed, as are pharmaceut computations computating an LBP polypeptide or nucleic acid, and valuating a cell having an abnormation of the construction of the confidence of the conf
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated low density lipoprotein binding polypeptide for treat diagnosing and/or identifying therapeutic agents for atheroscleros

describes a purified DNA encoding a potassium (K+) channel tein, KChAP. The K+ channel associated protein (KChAP) es are useful in screening agonists and antagonists of the e, and for making cells having increased numbers of KV he cellular plasma membrane. Such cells are useful model tudying the effect of pharmacological agents on KV channels, on KV2.1, KV2.2, KV1.3 and KV4.3 channels. The KChAP can be used to produce antibodies specific for the protein. The KChAP may be useful as therapeutics for treating cardiac ypertension, angina, asthma, diabetes, renal insufficiency, tinence, irritable colon, epilepsy, cerebrovascular autoimmune disease. This may be acid sequence of itor of activated STAT (piasy), the amino acid sequence of itor of activated STAT (piasy), the acidic domian of which other the colon. 0; l chaperone protein and encoding genes, useful in gene he treatment of hereditary diseases or for making cells sed numbers of voltage gated channels on the cellular plasma Gaps evelopmental biology; cell signalling; insecticide; ; 0 1.9%; Score 10; DB 5; Length 22; 100.0%; Pred. The invention relates to an isolated nucleic acid detection reage capable of detecting 1000 or more genes from Drosophila. The invense full in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development insecticides, therapeutics and pharmaceutical drugs. The inventic discloses genomic DNA sequences (ABL16176-ABL30511), expressed DN acquences (ABL16175) and the encoded proteins (ABBS7377-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format dire from WIPO at ftp.wipo.int/pub/published_pct_sequences

lence such that the allergen lacks or comprises reduced epitopes and/or exhibits reduced binding capacity for IgE is reduced IgE production stimulatory activity while antigenicity. Also described: (1) a composition odified allergen which lacks or comprises reduced numbers and/or exhibits reduced binding capacity for IgB and/or ad IgB production stimulatory activity while retaining T-ity, and one or more pharmaceutical carriers and/or (2) prophylaxis or treatment of an allergic disease subject, by administering a modified allergen defined ified recombinant allergen is useful in the immunocherapy lactic treatment of allergic diseases such as type I rention describes a modified recombinant allergen in ring form and which is associated with allergic disease sensitive subjects. The modified recombinant allergen into acid sequence modified from the naturally occurring

The invention relates to an isolated mucleic acid comprising amy to the 6213 antisense sequences given in the specification where expression the mucleic acid inhibits proliferation of a cell. Also include (1) a vector comprising a promoter operably linked to the mucleic cacid, (2) a host cell containing the vector; (3) an isolal polypeptide voice tragment whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically be antisense nucleic acid, (4) an antibody capable of specifically be antisense nucleic acid, (4) an antibody capable of specifically be antisense nucleic acid, (4) an antibody capable of specifically be antisense nucleic acid, (4) an antibody capable of specifically be proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the active proliferation, (7) identifying a compound that inhibits cellular proliferation or that has an activity against a biological path agene product or that has an activity against a biological path agene on which the test compound that inhibits proliferation or the test compound that inhibits or organism acts, (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the strains; or (13) identifying the target of a compound that inhibit proliferation of an organism. The antisense nucleic acids are useful infernation of an organism. The antisense nucleic acids are identifying proteins or screening for homologous nucleic acids active contains and account of an organism. The missense nucleic acids are useful identifying proteins or screening for homologous nucleic acids active ac
                                                                                                                                                                                                                                                                                                                                                               Antisense; prokaryotic essential gene; cell proliferation; drug de
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense nucleic acids, useful for identifying proteins or s
for homologous nucleic acids required for cellular proliferation
isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ohlsen KL,

This invention describes a novel method of desensitizing a patient polypeptide allergen and comprises administering to the patient a derived from the allergen where restriction to a MHC class II mole opsessed by the patient can be demonstrated for the peptide and t peptide is able to induce a late phase response in an individual w possesses the MHC class II molecule. The methods can be used for desensitising patients to allergens present in e.g. grass, tree and including ragweed) pollens, fungi and moulds, foods, stinging ins the chiromidae (non-biting midges), spiders and mites, housefly, for steep worm fly, grain weevil, silkworm, honey non-biting midge larvae, bee moth larvae, mealworm, cockroach, larvat renibrio molitor beetle, mammals such as cat, dog, horse, cow, pig sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be used conductions involving hypersensitivity to allergens. This sequence conditions involving hypersensitivity to allergens. This sequence

This invention describes a novel method of desensitizing a patient polypeptide allergen and comprises administering to the patient a derived from the allergen where restriction to a MHC Class II mole possessed by the patient can be demonstrated for the peptide and possessed by the patient can be demonstrated for the peptide and possesses the MHC Class II molecule. The methods can be used for constitution patients to allergens present in e.g. grass, tree and including ragawed) pollens, fungi and moulds, foods, stinging in the chiromidae (non-biting midges), spiders and mites, housefly, for the chiromidae (non-biting midges), spiders and mites, hone non-biting midge larvae, bee moth larvae, mealworm, cockroach, larvaber politor beetle, mammals such as cat, dog, horse, cow, pis sheep, rabbit, rat, guinea pig, mice or gerbil. They can also be produce immunological vaccines which may be used to prevent and/or conditions involving hypersensitivity to allergens. This sequence represents a Phieum sp. (Timothy grass) Phl p 5a allergen Desensitizing patients to polypeptide allergens. (IMCO-) IMPERIAL COLLEGE INNOVATIONS LTD. relates to a novel method for desensitising an individual polypeptide antigen. The method comprises administering a at contains polypeptide antigens in an amount that he individual a state of hyporesponsiveness to the antigen shitsation to one or more polypeptide antigens. The method on has immunomodulator activity, and may have a use in gene omposition and method are useful in manufacturing a desensitising an individual to a selected polypeptide generating in the individual a state of hyporesponsiveness to allow desensitisation to one or more polypeptide present sequence is used in the exemplification of the
                                              an individual to a selected polypeptide antigen comprises a composition containing polypeptide antigens in an amount a state of hyporesponsiveness to the antigen to allow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          fication; signal transduction pathway; metabolic pathway;

The human ORFX open reading frames 1 to 3161. The ORFX activities such as: cytostatic; hepatotropic; vulnerary; antiparkinsonian; noctropic; neuroprotective; osteopathic; antiparkinsonian; noctropic; neuroprotective; osteopathic; antiarthriti; immunosuppressant; immunostimulant; ubolytic; coagulant; vasotropic; antidiabetic; hypotensive; immunosuppressive; antiniflammatory; antibaterial; tungal; antirheumatic; antithiflammatory; antianterial; thugal; antirheumatic; antithyroid; and antianaemic. The e used for determining the presence of or predisposition. By or treating pathological conditions associated with an idisorder. The nucleic acids can be used to express ORFX the therapy vectors. The proteins and nucleic acids may be sancers, proliferative disorders, neurodegenerative coarthritis, graft vs host disease, cardiovascular disease, us, hypertension, hypothyroidism, cholesterol ester ic lupus erythematosus, severe combined immunodeficiency viral, bacterial or fungal infection, malaria, autoimmune ma, allergies, aplastic anaemia, burns, wounds, bone and je, nocturnal haemoglobinuria, antiinflammatory disease; to ition; to inhibit thrombosis; and as a contraceptive
noids and peptides derived from open reading frame X, thing e.g. cancers, proliferative disorders, ve disorders and cardiovascular disease.

Tuence is the protein sequence of a human polypeptide ne that exhibits increased expression in colon cancer-ses compared to normal colon tissue. It is an example of utides that are encoded by genes which are differentially statestaic colorectal cancer cells. Such polypeptides are instit and prognostic assays, for raising antibodies useful therapy, and in screening for modulator compounds of

epresents the maize chromosome 1 indeterminate (Id) a zinc finger regulatory protein that plays a crucial role from vegetarive to reproductive development, controlling of other genes required for floral development. Loss of Id prolonged vegetative development. Understanding the its regulation provides a basis for producing specialized to flower and produce seed independent of native internal frommental effects. Methods are provided for producing ected times of transition from the vegetative to the oral induction gene, used for producing plants with of transition from the vegetative to the flowering stage. 80pp; English.

flowering stage. They can result in either earlier cessation of vegetative growth and initiation of flowering, or in later flowering the absence of floral induction. The plante can be induced to flow set seed prior to adverse weather. Similarly, flower induction can prolonged for short-season plants grown in areas with long periods warm weather. As a result of the extra vegetative mass and carbohy these plants can produce more and/or larger flowers and, consequen more seed. Plants can even be prevented from flowering, thus provin nutritious silage biomass. They can also be used to eliminate the for detasseling in the production of hybrids

Novel polypeptide referred to as indeterminate 1 from ryegrass or species, useful for modifying plant life cycles and growth phases flowering processes, plant architecture, inflorescence, flower development

Example 2; Fig 7; 80pp; English.

The present invention describes a substantially purified or isolate polypeptide (I) from a ryegrass (Lolium) or fescue (Festuca) specific from indeterminate I (IDI) and IDI-like proteins, its functionally fragments and variants. Polyucolectide sequences (II) encoding (I) used for modifying plant life cycles and/or growth phases such as the lowering processes, (ID wearing and plant architecture, inflorescent flower development. (II) can also be used as a genetic marker. (I) can be used for facilitating immunological screening of convexpression libraries. (II) is useful for isolating cDNAs and genes encoding homologous proteins from the same or other plant species, hybridisation probes to screen libraries from the desired plant. (C useful in amplification protecols to amplify longer nucleic acid on nucleic acid fragments encoding homologous genes for DNA or RNA. (C also useful as a molecular genetic marker for quantitative trait in c (QTL) tagging, QTL mapping, DNA fingerprinting and in marker assist

The polynuclectides and polypeptides are useful for treating inflammatory conditions such as arthritis, nephritis, crot disease, ischaemia-reperfusion injury, shock, sepsis, immune respond and cancer and for promoting wound healing. The sequences are used induce the proliferation of neural cells and regeneration of nerve hervous system disease and neuropathies, such as Alzheimer's disease Parkfinson's disease and neuropathies, such as Alzheimer's disease sand neuropathies, such as Alzheimer's disease Sclerosis. The sequences are involved in chemotactic or chemokinetia cultivity, regulation of haematopolesis, treatment of myeloid or lymphonesis and platelet disorders such as thromboytopenia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    regeneration of bone, cartilage, tendon, ligament and/or nerve tiss growth, tissue repair, healing of burns, incisions, ulcers, treatme osteoporosis, osteoarthritis, bone degenerative disorders and periodisease. The sequences of the invention are also useful for gut
                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human novel polymucleotides and associated

nucleic acids, useful for identifying proteins or screening s nucleic acids required for cellular proliferation to late molecules for rational drug discovery programs.

ID NO 50659; 1766pp; English.

relates to an isolated nucleic acid comprising any one of sense sequences given in the specification where expression a acid inhibits proliferation of a cell. Also included are: comprising a promoter operably linked to the nucleic acid typeptide whose expression is inhibited by the antisense (2) a host cell containing the vector; (3) an isolated it its fragment whose expression is inhibited by the est acid; (4) an antibody capable of specifically binding le; (5) producing the polypeptide; (6) inhibiting cellular or the activity of a gene in an operon required for (7) identifying a compound that influences the activity of it or that has an activity against a biological pathway confideration, or that inhibits cellular proliferation; (8) gene required for cellular proliferation; (8)

pathway in which a proliferation-required gene or its gene produc or a gene on which the test compound that inhibits proliferation corganism acts; (1) manufacturing an antibiotic; (10) prolifing a compound's activity; (11) a culture comprising strains in which product is overexpressed or underexpressed; (12) determining the product is overexpressed or underexpressed; compound that inhibit to which each of the strains is present in a culture or collectic strains; or (13) identifying the target of a compound that inhibit proliferation of an organism. The antisense nucleic acids are use identifying proteins or screening for homologous nucleic acids re-for cellular proliferation to isolate candidate molecules for rat drug discovery programs, or for screening homologous nucleic acid required for proliferation in cells other than S. aureus, S. typh K. pneumoniae or P. aeruginosa. The present sequence is encoded b the target prokaryoric essential genes. Note: The sequence data f patent did not form part of the printed specification, but was ob in electronic format directly from WIPO at

```
ecting 1000 or more genes from Drosophila. The invention is alopmental biology and in elucidating cell signalling and ractions in higher ewkaryotes for the development of therapeutics and pharmaceutical drugs. The invention omic DNA sequences (ABL16176-ABL30511), expressed DNA 101840-ABL16175) and the encoded proceens (ABB57737-s sequence data for this patent did not form part of the fication, but was obtained in electronic format directly ftp.wipo.int/pub/published_pot_sequences
relates to an isolated nucleic acid detection reagent

relates to an isolated nucleic acid comprising any one of ense sequences given in the specification where expression acid inhibits proliferation of a cell. Also included are: Omprising a promoter operably linked to the nucleic acid (2) a host cell containing the vector; (3) an isolated etc acid, (4) an antibody capable of specifically binding or the activity of a gene in an operon required for or that has an activity against a biological pathway rolleration, or that has an activity against a biological pathway rolleration, or that inhibits cellular proliferation; (8) gene required for cellular proliferation of an original pathway relative for confidence or the biological pathway incliferation or that inhibits cellular proliferation of an original pathway incliferation or chall are compound that inhibits proliferation of an (9) manufacturing an antibiotic; (10) profiling a respressed or underexpressed; (12) determining the extent of the strains is present in a culture or collection of the strains is present in a culture or collection of an ivity; (11) a culture comprising strains in which the extent of the strains is present in a culture or collection of 3) identifying the target of a compound that inhibits the of an organism. The antisense nucleic acids required rollectation to isolate candidate molecules for rational programs, or for screening homologous nucleic acids required or proliferation to isolate candidate molecules or respinal rollectation. or P. aeruginosa. The present sequence is encoded by one of karyotic essential genes. Note: The sequence data for this form part of the printed specification, but was obtained format directly from WIPO at ub/published_pct_sequences

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

Claim 20; SEQ ID NO 55869; 103pp; English.

The invention relates to isolated polymucleotide (I) and polypept sequences. (I) is useful as hybridisation probes, polymerase chair reaction (PCR) primers, oligomers, and for chromosome and gene maj and in recombinant production of (II). The polymucleotides are all of diagnostics as expressed sequence tags for identifying express. (I is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving or contains a colypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding patrners are useful in medical in of sites expressing (II). (I) and (II) are useful in medical in of supplement protein expression or biological activity. The colypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodivally amino acid sequences. Absonotor Propersent novel human diagnostic amino acid sequences. The secuence of the invention of the formal and products dependent on DNA is mained and produce of the invention of the formal and and and and amino acid sequences. patent did not appear in the printed specification, but was obtain electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences sequences of the invention. Note: The sequence data for amino acid

```
forensics, gene mapping, identification of mutations or genetic disorders or other traits and to assess
```

ID NO 48036; 103pp; English

is useful as hybridisation probes, polymerase (11) is useful as hybridisation probes, polymerase chain primers, oligomers, and for chromosome and gene mapping, inant production of (11) The polymiciocitides are also used as expressed sequence tags for identifying expressed useful in gene therapy techniques to restore normal II) or to treat disease states involving (II). (II) is nexating antibodies against it, detecting or quantitating a nissue, as molecular weight markers and as a food II) and its binding partners are useful in medical imaging essing (II). (I) and (II) are useful for treating disorders rrant protein expression or biological activity. The nd polynuclectide sequences have applications in foremacks, gene mapping, identification of mutations or genetic disorders or other traits to assess biodiversity quences. ABGO0010-ABG30377 represent novel human diagnostic the appear in the printed specification, but was obtained in rmat directly from WIPO at relates to isolated polynucleotide (I) and polypeptide (II)

Juence represents the D.melanogaster retinal degeneration B 3), which is a non-receptor tyrosine kinase binding WA that encodes this protein had previously been identified al, Journal of cell biology, volumn 122: 1013-1022, 1993. Is a false stop codon sequencing error in this reference, he sequence to be incorrectly interupted as a member of the elonant family of proteins, thus the Pyk-2 binding domain tidentified. Durdes conterned with PI transfer and regulating and is thus concerned with PI transfer and regulating as signalling respectively. This protein is seen to be gnalling transduction pathways and therefore would be notis, treatment, and prevention of the following diseases: vis; neuroblastoma; thrombocytopaenia; stroke; Alzheimer's; Parkinson's; depression; schizophrenia; pain epilepsy

```
The invention relates to an isolated nucleic acid detection reagen capable of detecting 1000 or more genes from Drosophila. The inven useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher elucaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABR3072). The sequence for this patent did not form part of printed specification, but was obtained in electronic format direction WIPO at ftp.wipo.int/pub/bublished_pct_sequences

nucleic acid detection reagent for detecting 1000 or more osophila and for elucidating cell signaling and cell-cell

30 ID NO 23202; 21pp + Sequence Listing; English.

relates to an isolated nucleic acid detection reagent secting 1000 or more genes from Drosophila. The invention is slopmental biology and in elucidating cell signalling and the restrictions in higher eukaryotes for the development of therapeutics and pharmaceutical drugs. The invention DML DNA sequences (ABL16176-ABL30511), expressed DNA 101840-ABL16175) and the encoded proceins (ABBS7737-sequence data for this patent did not form part of the fication, but was obtained in electronic format directly the wipo.int/pub/published_pct_sequences

Gaps

Corynebacteium glutamicum nucleic acide encoding membrane constru and membrane transport proteins or their portions, useful for typ identifying C. glutamicum or related bacteria, and as markers for transformation.

Claim 20; Page 242-246; 1119pp; English.

AAR67743 to AAR68080 encode the Corynebacterium glutamicum membras construction and membrane transport (MCT) proteins given in AAB76 AAB76847. The MCT nucleic acids and proteins are useful in the identification of microorganisms which can be used to produce finichemicals, for modulating fine chemical production in C. glutamic related bacteria (e.g. Brevibacterium lactofermentum), the typing identification of C. glutamicum or related bacteria, as reference for mapping C. glutamicum genome, and as markers for transformatic AAF68082 and AAF68081 represent sequencing primers which are used example from the present invention

The invention relates to constructing (M1) a strain of diploid fucile in which both alleles of a gene are modified, comprising more allele by insertion or replacement by a casestete having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterolo promoter. While is useful for constructing a strain of diploid furcells in which both alleles of a gene are useful for identifying a gis essential to the survival or growth of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a fungus, and for identifying a therapeutic agent for reatment of a mammal of a diploid fungus. The contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid and for identifying a therapeutic agent for treatment of a mammal of season. (M1) is useful for identifying a compound which modulate activity of a gene product, preferably enzymatic activity, carbon compound catabolism, biosynthetic, transporter, transcriptional, translational, signal transduction, DNA replication and cell divice ability to inhibit growth or proliferation of C. albicans cells a treating infection by C. albicans. The present sequence is that or essential candida albicans protein used in the method of the inverse specification but is based on sequence information supplied to De the burners of the control of the sequence information supplied to De
                                                                       Constructing strains for identifying gene products as effective t for therapeutic intervention, by inactivating in the strain one a a gene and placing other allele of the gene under conditional exp

The invention relates to recombinant yeast with improved productive thy1 caproate by introducing mutations intonto fatty acid synthet (ABB0801). The yeast is used for improved productivity of ethy1 capresent decreasing the fermentation characteristic features of year present sequence is that of the yeast fatty acid synthetase mutant. The present sequence is not shown in the specification but is derificent the yeast fatty acid synthetase sequence given as SEQ ID NO 18-12 (ABB08801)
   ß
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant yeast for improved productivity of ethyl caproate, and producing food, comprises a mutated fatty acid synthetase gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Yeast; fatty acid synthetase; ethyl caproate; fermentation; enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Бa

; 28pp; Japanese

relates to recombinant yeast with improved productivity of a by introducing mutations intonto fatty acid synthetase ne yeast is used for improved productivity of ethyl caproate ssing the fermentation characteristic features of yeast. The nce is that of the yeast fatty acid synthetase mutant. Note: equence is not shown in the specification but is derived thatty acid synthetase sequence given as SEQ ID NO 1, Page

The invention relates to multiprotein complexes from eukaryotes. I of the invention and DNA sequences encoding them are given in reconstances. BAR\$2568-BR\$3903 and ACG60610-ACG61944 respectively. The complexe obtainable by using a protein as a bait and isolating the set of I which is attached thereof from cells. Such protein complexes may up to 30 distinct proteins. Protein complexes may for diagnosing a disease or disorder, or as a target for an active of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for tpatent is not represented in the printed specification, but is bas sequence information supplied by the European Patent Office. The document is available on CD-ROM

The invention relates to three hundred and five nucleic acids encomplete per grant of transmembrane). The PRO nucleic acids polypeptides are useful for the manufacture of a medicament for diagnosing or treating tumour in a mammal, for measuring or detect expression of an associated gene, for stimulating or detect stimulating the release of tumour necrosis factor alpha (TNF-alpha human blood. The present sequence represents the amino acid seques secreted and transmembrane PRO protein. Note: The sequence data for patent din not form part of the printed specification but was obtained according to the protein user of the printed specification but was obtained state of the printed specification but was obtained substant of the printed specification but was obtained specification but was obtained specification of the printed specification but was obtained specification of the printed speci

The invention relates to an isolated PRO polypeptide. The PRO nuc sequences are useful as hybridisation probes in chromosome and ge mapping, for stimulating the release of tumour necrosis factor—al stimulating proliferation or differentiation of chondrocyte cells detecting the presence of tumour in a mammal, or in generating an RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules i in binding reaction, to generate transgenic animals or knockout a in binding reaction, to generate transgenic animals or knockout a cherapeutically useful reagents, for chromosome identification an typing. The PRO polypeptides and nucleic acid molecules are also in gene therapy, and as molecular weight markers for protein checkphoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PR recombinant cell culture or natural sources. The present sequence continued and transmembran

m glutamicum nucleic acids encoding membrane construction transport proteins or their portions, useful for typing or glutamicum or related bacteria, and as markers for

e 224-231; 1119pp; English.

AF68080 encode the Corynebacterium glutamicum membrane and membrane transport (MCT) proteins given in AAB76510 to MCT nucleic acids and proteins are useful in the common of microorganisms which can be used to produce fine r modulating fine chemical production in C glutamicum or cia (e.g. Brevibacterium lactofermentum), the typing or 1 of C glutamicum or related bacteria, as reference points glutamicum genome, and as markers for transformation.

AR68082 represent sequencing primers which are used in an he present invention

```
The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicu mare useful for identifying the mutation point of a gene derived funtant of coryneform bacterium, measuring expression amount and a coryneform bacterium, and identifying a homologue of a gene derived coryneform bacterium, and identifying a homologue of a gene derive coryneform bacterium. Coryneform bacteria and official for producin acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein describe exemplification of the invention. Note: The sequence data for thi did not form part of the printed specification, but was obtained electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotides derived from Coryneform bacteria, for ident mutation point of a gene, measuring expression of a gene, analyzi expression profile or pattern of a gene and identifying homologou

The present sequence is a polypeptide encoded by one of a large nu present sequence is a polypeptide encoded by one of a large nu prepared from mRNAs encoding secreted proteins. The 5' ESTs is prepared from total human RNAs or polyA+ RNAs derived from 30 diff tissues. EST sequences usually correspond mainly to the 3' untrans region (UTR) of the mRNA because they are often obtained from olig primed cDNA libraries. Such ESTs are not well suited for isolating sequences darived from the 5' ends of mRNAs and even in those case longer cDNA sequences have been obtained, the full 5' UTR is rarel included. 5' ESTs are derived from mRNAs with intact 5' ends and c therefore be used to obtain full length cDNAs and genomic DNAs. 5' are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory se and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedur

The products of the also be used to identify modulators of expression and odwn regulate expression and activity. The antibodies of may also be used as diagnostic agents for detecting the lypeptides in samples. This sequence represents a homologue de described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    describes novel polynucleotides and polypeptides isolated

To identify antigens of E. tenella, expression libraries were prilambda vector, lambda gt11, using cDNA prepd. from polyA mRNA ise from E. tenella oocysts. The cDNA expression library was screened monoclonal antibody (MAD) 12.07 which was raised against the spostage of E. tenella. The library to be screened was plated on a lallows lysis and plaque formation. During induction of the antigencoded by the phage, the plaques were identified by screening thiters with MAD 12.07. The cDNA inserts from the MAD 12.07 posiphage were cloned into bacteriophage M13 and subjected to sequence analysis. Ecllowing sequence analysis, E. tenella antigen tc-10a identified. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pope SH, Strausberg SI

The invention relates to an isolated polypeptide associated with growth, differentiation and death (GGDD). Also disclosed are the growth, differentiation and death (GGDD). Also disclosed are the polymetides encoding the polypeptides. The polypeptides and polymucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression (expression of CGDD. Such diseases include cell proliferative (e.g. expression of CGDD. Such diseases include cell proliferative (e.g. expression of CGDD. Such diseases include cell proliferative (e.g. expression of cGDD. Such diseases include cell proliferative (e.g. expression of disease, stroke), immunolyinflammatcory (e.g. AIDS, allergies) and reproductive disorders, or disorders of the placenta. They are a regul in assessing the effects of exogenous compounds on the exp of mucleic acid and amino acid sequences of CGDD. The CGDD or its fragments are useful in screening compounds that specifically bink modulate the activity of the polypeptide. Microarrays consisting protein-protein interactions, drug-target interactions, and gene expression profiles. Sequences given in records AAR69665.
                                                                                                                                                                                                                                                                                                     New human proteins associated with cell growth, differentiation, death (CGDD), useful for diagnosing, treating and preventing disconditions associated with the aberrant CGDD expression e.g. can

  1) relates to isolated polynucleotide (I) and polypeptide (II)
(2) is useful as hybridisation probes, polymerase chain
(3) primers, oligomers, and for chromosome and gene mapping,
(3) ninant production of (II). The polynucleotides are also used
(3) useful in gene therapy techniques to restore normal
(11) or to treat disease states involving (II). (II) is
(11) are to treat disease states involving (II). (II) is
(11) and its binding partners are useful in medical imaging
(2) sessing (II). (I) and (II) are useful for treating disorders
(2) states in modical imaging
(3) states in the useful for treating disorders
(4) states in the useful for treating disorders
(5) states in the polymeras are useful for treating disorders
(6) states in the polymeras are useful for treating disorders
(7) and (11) and (12) are useful for treating disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                                                                                                                                and polymucleotide sequences have applications in forensics, gene mapping, identification of mutations for genetic disorders or other traits to assess biodiversity et other types of data and products dependent on DNA and squences. ABG00010-ABG30377 represent novel human diagnostic aquences of the invention. Note: The sequence data for this t appear in the printed specification, but was obtained in 'pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ification; signal transduction pathway; metabolic pathway; assay; genetic mapping; gene expression control; promoter; sequence; corn.

                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                            ö
                                                                      Invention relates to human single exon nucleic acid probes 110068-AA128459). The present sequence is a peptide encoded probe. The SENPB are derived from human Hela cells. The SENPS to produce a single exon microarray, which can be used for an gene expression in a sample derived from human cervical lls. By measuring gene expression, the probes are therefore ding and/or staging of diseases of the cervix, notably ser. Note: The sequence data for this patent did not form printed specification, but was obtained in electronic format wideo at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     relates to an isolated nucleic acid detection reagent etecting 1000 or more genes from Drosophila. The invention is relopmental biology and in elucidating cell signalling and creactions in higher eukaryotes for the development of therapeutics and pharmaceutical drugs. The invention
derived single exon nucleic acid probes useful for analyzing
on in human cervical epithelial cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              nucleic acid detection reagent for detecting 1000 or more rosophila and for elucidating cell signaling and cell-cell

discloses genomic DNA sequences (ABL16176-ABL30511), expressed D. sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737 ABB72072). The sequence data for this patcht did not form part o printed specification, but was obtained in electronic format direction will be a from WIFO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              single exon nucleic acid probes may be used for predicting, meass displaying gene expression in samples derived from human fetal 1: present sequence is a peptide encoded by a single exon nucleic at of the invention. Note: The sequence data for this patent did not part of the printed specification, but was obtained in electronic directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a single exon nucleic acid probe for men human gene expression in a sample derived from human foetal live:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human genome-derived single exon nucleic acid probes useful for

By measuring gene expression, the probes are useful for predictin diagnosing, grading, mention, morphoping and prognosing diseases human heart and vascular system e.g. cardiovascular disease. hypertension, cardiac arrhythmias and congenital heart disease. Negeuence data for this patent did not form part of the printed specification, but was obtained in electronic format directly fro at fit, wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to single exon nucleic acid probes measuring human gene expression in a sample derived from human he ABA21535-ABA41305). The present sequence is a protein encoded by probe. The probes may be used for predicting, measuring and displayene expression in samples derived from the human heart via micro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; bone marrow expressed exon; gene expression analysis; prob microarray; cancer; leukaemia; lymphoma; myeloma.

measuring human gene expression in a sample derived from human at liver, comprising one of 13109 defined nucleotide sequences given specification (or complements/ fragments). The probe hybridises stringency to a nucleic acid molecule expressed in the human adul. (I) may be used for predicting, measuring and displaying gene exi in samples derived from human adult liver. The genes identified involved in genetic liver diseases such as cirrhosis, hyperlipoproteinaemia, hyperlipidaemia and hypercholesterolaemia
                                                                                                            probes which are derived from genomic sequences expressed in the brain. They can be used to measure gene expression in brain cell which may enable the diagnosis and improved treatment of nervous diseases such as Alzheimer's disease, multiple sclerosis, schizo epilepsy and cancers. The present sequence is a protein encoded the probes of the invention
Single exon nucleic acid probes for analyzing gene expression in brains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human, liver, cirrhosis, hyperlipoproteinaemia, hyperlipidaemia, hypercholesterolaemia, coronary heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human genome-derived single exon nucleic acid probes useful for gene expression in human adult liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a single exon nucleic acid probe (SENP)
                                                                                                The present invention provides a number of single exon nucleic
                                                                                                                                                                                                                                                                                                                                ;

ressable set of single exon nucleic acid probes, used to expression in human lung samples.

ID NO 32211; 634pp; English.

relates to a spatially-addressable set of single exon probes for measuring gene expression in a sample derived ng comprising single exon nucleic acid probes having one of acid sequences mentioned in the specification, or their r the 12387 open reading frames derived from the 12614 included are a microarray comprising the novel set of probes which hybridise at high stringency to a nucleic d in the human lung; measuring gene expression in a sample human lung, comprising (a) contacting the array with a

mRNA, and (b) measuring the label detectably bound to each probe array; identifying exons in a eukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequence the eukaryote; and (b) detecting specific hybridisation of detect labeled nucleic acids from eukaryote lung mRNA, to a single exon having a fragment identical to the predicted exon, the probe is in the above mentioned microarray; assigning exons to a single ge comprising of a) identifying exons from genomic sequence by the met above and (b) measuring the expression of each of the exons in setissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern expression of the exons in the issues and/or cell types indicate the exons should be assigned to a single gene; a peptide comprisit of 12011 sequences, mentioned in the specification, or encoded by probes/open reading frames (ORF). The probes are used for gene examples in a for identifying exons in a gene, particularly using the exit of the exons in the study of lung diseases such as astely and control in the study of lung diseases such as a sight and the exit of the exons in the study of lung diseases such as a sight and the exit of the exons in the study of lung diseases such as a sight and the exit of the exons in the study of lung diseases such as a sight and the exons and the study of lung diseases such as a sight and the exons and the study of lung diseases such as a sight and the exons and the study of lung diseases such as a sight and the exons and the study of lung diseases such as a sight and the exons and the study of lung diseases such as a sight and the exons and the study of lung diseases such as a sight and the exons and the study of lung diseases and as a sight and the exons and the exons and and the exons and a sight and the exons and the exons and the exons and the exons and the exon cancer, chronic obstructive pulmonary disease (COPD), interstitia disease (ILD), familial idiopathic pulmonary fibrosis, neurofibro tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Herm Pudlak syndrome, sarcoidosis, pulmonary haemosiderosis, pulmonary histiocytosis, lymphangiolelomycontosis, pulmonary alveolar protei Karagener syndrome, fibrocystic pulmonary dysplasia, primary cili dyskinesis, pulmonary hypertension and hyaline membrane disease. present sequence is a peptide/protein encoded by a single exon pr the invention. Note: The sequence data for this patent did not for of the princed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

Induction of gene to be expressed in plant under a strong light a condition - useful for enabling plant to grow in desert.

Claim 3; Page 9; 16pp; Japanese.

Д

```
i represents a clone of the protein of the invention. The ates to a gene that is induced and expressed in a plant ig light adapting conditions, and is prepared by a procedure of the following light irradiations (1) to (3) is made on a 'irradiated by a light irradiations (1) to (3) is made on a sisting of a continuous wave length component of a wave of 300-800 nm at 15 to 38 degrees C and the gene expression nduced in the call of said plant: (1) A light of a light 300-700 nm E/Sq. m s consisting of a continuous wave length a wave length region 6 300-800 nm at 15-38 degrees C for 1 sisting of a continuous wave length component of a light intensity of 200-600 nm issting of a continuous wave length component of a wave of 350-560 nm at 15-38 degrees C for several hours to (3) a light of intensity 75-270 nm E/Sq. m s consisting of wave length component of a wave length component of a wave length region of 300-800 nm iss C for several hours to several days. The method can be stating a transgenic plant that is able to grow in the desert
